TABLE OF CONTENTS

INTRODUCTION V

Figures

1. Distribution of naturally fluoridated water supplies IX
2. Naturally fluoridated water supplies, by States and regions X
3. Naturally fluoridated water supplies, by average fluoride concentration XI
4. Size of communities with naturally fluoridated water supplies XI

Tables

Number of communities with natural fluoride content of 0.7 ppm or greater in one or more water sources showing:

1. Population for single and multiple water sources and for those reported by maximum and minimum fluoride content, by States XII
2. Fluoride concentration of water sources, by States XIII
3. Water sources by specific fluoride content XV
4. Population size of community XVII

PART 1: Communities with naturally fluoridated water sources containing 0.7 ppm fluoride or more by State 1

PART 2: Naturally fluoridated communal water sources by fluoride content and States for:---

A. Communities with single water sources 43
B. Communities with multiple water sources 77
C. Communities reporting maximum and m'nimum fluoride content of water sources 98

INTRODUCTION

A census of community water sources which contain fluoride naturally was made by the Dental Directors of all State health agencies during late 1956 and early 1957 at the request of the United States Public Health Service. These data, compiled for the total United States, arranged into tabulations and listings, are presented in this report. They furnish reference material for use by individuals and agencies interested in detailed information about drinking water sources in each of the States, as well as in specific communities.

All communities enumerated have at least one water source with 0.7 ppm or more fluoride concentration--the minimum level which may provide optimum protection from dental caries in the United States. Whenever a community was included because one of its water sources met this criterion, all water sources of that place were shown, including those with fluoride levels of less than 0.7 ppm. As a result, there are 125 communities included in this survey for which the average fluoride content of all water sources combined is less than 0.7 ppm.

In compiling the data, communities were grouped according to number of water sources used. It was assumed that a community had a single water source if only one fluoride concentration was reported; if multiple concentrations were reported, it was assumed that each fluoride concentration represented a separate water source. For the States of Louisiana, New Mexico and Texas, as well as for a few scattered communities in 3 other States, the maximum and minimum fluoride levels of drinking water were reported for each community, without specifying the number of water sources. These communities were grouped separately from those with single or multiple water sources reported.

Preceding page blank

At the beginning of 1957, there were 1,903 communities in the United States with at least a single source of drinking water with a natural fluoride concentration of 0.7 ppm or more. More than half (52 percent) of these communities are located in 6 States--Illinois, Indiana, Iowa, Ohio, South Dakota and Texas (Table I and Figures I and 2).

The States of Maine, Vermont, Massachusetts, Pennsylvania and Delaware reported no known communal water sources with natural fluoride levels of 0.7 ppm or more.

Over 6,952,000 persons reside in communities that have natural fluoride-bearing water sources with minimum concentrations of 0.7 ppm. Of this number, about 40 percent dwell in Texas. In New Mexico, 68 percent of the total State population (the largest proportion of any State) live in areas supplied by at least one communal water source which naturally bears a fluoride level of at least 0.7 ppm.

Of the 1,903 communities enumerated, 1,119 have single water sources; 320 have multiple water sources; and for 464 places maximum and minimum fluoride concentrations were reported, without specification as to the number of water sources utilized.

Natural fluoride water concentrations averaging 0.7 - 1.1 ppm are present in 895 communities with about 4,256,000 residents, or 61 percent of the total population provided with natural fluoride-bearing drinking water (Table II and Figure 3). This range approximates the recommended fluoride levels for optimal dental caries control in the United States. Average fluoride levels of 1.2 - 1.4 ppm are found in the water supplies of 263 communities with 598,000 persons (9 percent of total), and at the top of the scale there are 620 communities with about 1,400,000 people (20 percent of total) with fluoride concentrations in their drinking water of 1.5 ppm

or greater. The remaining 125 communities, with about 698,000 persons (10 percent of total) have average fluoride levels of less than 0.7 ppm. Communities with average fluoride levels of less than 0.7 ppm are reported because: 1. They have multiple water sources of which at least one source has a minimum concentration of 0.7 ppm or greater, or, 2. They have reported maximum and minimum fluoride levels and the maximum concentration is 0.7 ppm or greater.

There are 270 communities with about 1,539,000 people supplied water with average concentrations of 0.7 ppm (Table III)--the largest single group of communities and persons when the data are arrayed by specific fluoride content of water sources. The second largest group of communities, and also the second largest number of individuals is found at the 0.8 ppm fluoride level. The average fluoride levels of the water supplies in the communities enumerated range from below 0.7 ppm to as high as 7.7 ppm.

There are 15 cities with populations of over 50,000 that include 35 percent of the 7 million people consuming water from sources with natural fluoride content of 0.7 ppm or above. Cities in the 5,000 to 50,000 size group served 38 percent of this population; those ranging in size from 1,000 to 5,000 persons served 20 percent; and those under 1,000 persons, 7 percent. (Table IV and Figure 4).

Listings of Communities

The basic data have been arranged into 2 listings. In Listing #1, communities with drinking water sources which contain minimum natural fluoride concentrations of 0.7 ppm are arranged alphabetically, by State. For each place, the population size and the natural fluoride concentration of each water source is given. However, if the same fluoride concentration was reported for more than one water source in a community, that concentration is

listed only once. Places for which maximum and minimum fluoride concentrations were reported are identified by asterisks, and usually both fluoride levels are given. (If only one fluoride level is shown for one of these communities, in Louisiana it refers to maximum fluoride concentration, in New Mexico to average, and in Texas to the minimum concentration.)

In Listing #2, communities provided natural fluoride-containing water are presented in three sections: (A) single water source, (B) multiple water sources, and (C) maximum and minimum fluoride content reported. Within each section of this list, communities are grouped according to the following ranges of fluoride concentration: Less than 0.7 ppm; 0.7 - 1.1 ppm; 1.2 - 1.4 ppm; 1.5 - 2.9 ppm; 3.0 - 4.9 ppm; and 5.0 ppm or more. Communities with single water sources (Part A) are listed only once; communities with multiple water sources (Part B) are listed in one or more fluoride content ranges as determined by the natural fluoride level of each water source, but appear only once within the same range. Communities with maximum and minimum fluoride concentrations reported (Part C) are listed only once, and are shown in the range that represents the average of the two fluoride levels reported.

Populations shown for each community were obtained from Bureau of the Census sources, unless more current population estimates were provided by the State Health agencies.

COMMUNITIES GROUPED IN SELECTED RANGES OF FLUORIDE CONTENT AND BY STATE:

A. WITH SINGLE COMMUNITY WATER SOURCE HAVING NATURAL FLUORIDE CONTENT OF 0.7 PPM OR GREATER,
B. WITH MULTIPLE COMMUNITY WATER SOURCES IN WHICH AT LEAST ONE SOURCE HAS NATURAL FLUORIDE CONTENT OF 0.7 PPM OR GREATER,
C. THOSE REPORTED BY MAXIMUM AND MINIMUM NATURAL FLUORIDE CONTENT OF COMMUNITY WATER SOURCES IN WHICH THE MAXIMUM IS 0.7 PPM OR GREATER.

A. COMMUNITIES WITH SINGLE WATER SOURCE REPORTED:

B. COMMUNITIES WITH MULTIPLE WATER SOURCES REPORTED:
(COMMUNITIES MAY BE LISTED MORE THAN ONCE DEPENDING ON THE FLUORIDE CONTENT OF THEIR VARIOUS WATER SOURCES. HOWEVER, IF THE FLUORIDE CONCENTRATION OF TWO SEPARATE SOURCES FALL WITHIN A SINGLE RANGE OF FLUORIDE CONCENTRATION OF THE SIX LISTED BELOW, THE COMMUNITY WILL BE LISTED ONLY ONCE WITHIN THAT RANGE.)
